

By introducing modern IP video cameras, road and railway traffic control, signalization and data storage the digital wireless product SparkWave and SparkLight allow fast and efficient deployment of networks where point to point and point to multipoint technology is implemented in order to provide a cost effective and fast deployment.

Mandatory equipment like servers, radars, PBX etc are being connected to central office in order to facilitate efficient control and smooth data flow among different governmental institutions in the country and when needed on pan-European or pan-regional level.

In traffic, especially in railways, an uncompromised reliability is required to provide safety. Railway crossing, signaling, video monitoring and other systems need to be available continually without failures. SDH rings provide such reliability. ADM 16/4/1 are the product families that are suitable for above implementations.
